```

# Setting up the DE table for GO analysis

#### File Input

Input the output from DE analysis. This is made for a list that includes only the significant genes.

```
sigOnly <- read.table(paste("../../../requisiteData/data_06Sept2017/", sample1,"_",sample2,"_DE_sig.
sigOnly$logFC <- as.numeric(as.character(sigOnly$logFC))
colnames(sigOnly)[1] <- "itag"</pre>
```

#### Subset

First I need to subset the list to up or down regulated, then add a new colum that specififys 1. This column is need to for merging.

```
upITAG <- subset(sigOnly, logFC > 0, select = c(itag))
upITAG$up <- 1

downITAG <- subset(sigOnly, logFC < 0, select = c(itag))
downITAG$down <- 1

allITAG <- subset(sigOnly, select = c(itag))
allITAG$all <- 1</pre>
```

#### Merge I - with normalized ITAG length gene list

read in guide.

```
geneLength <- read.csv("../../../requisiteData/normalized_genes_length.csv")

## remove trailing numbers in ITAG
geneLength$itag <- gsub("^(.*)[.].*", "\\1", geneLength$itag)
geneLength$itag <- gsub("^(.*)[.].*", "\\1", geneLength$itag)

#isolate just the gene list
genes <- subset(geneLength, select = c(itag))</pre>
```

First merge each table to geneLength

```
upITAGmerge <- merge(genes, upITAG, by = "itag", all = TRUE)
downITAGmerge <- merge(genes, downITAG, by = "itag", all = TRUE)
allITAGmerge <- merge(genes, allITAG, by = "itag", all = TRUE)</pre>
```

### Merge II - Merge them all together.

```
matrixGOupdown <- merge(upITAGmerge, downITAGmerge, by = "itag", all = TRUE)
matrixGOupdownall <- merge(matrixGOupdown, allITAG, by = "itag", all = TRUE)
matrixGO <- merge(matrixGOupdownall, geneLength, by = "itag", all = TRUE)</pre>
```

## Clean Up

```
matrixGO[is.na(matrixGO)] <- 0</pre>
head(matrixGO)
##
              itag up down all length

# Subseting for GO analysis

Specify the column you are interested in pat\$all refers to all the DE gene regardless if they are up or down regulated. If you want to specify down regulated, specify pat\$down. I am going to put this into a loop, where each time the loop goes thought it will perform GO enrichment on all three types of lists of significant genes and them write them to a table.

```
sigType <- c("up", "down", "all")</pre>
for (type in sigType) {
  genes = as.integer(pat[,type])
  names(genes) = pat$itag
  table(genes)
 length(genes)
 pwf = nullp(genes, bias.data = pat$length)
  GO.wall = goseq(pwf, gene2cat = cate)
  head(GO.wall)
#This is going to correct for multiple testing. You can specify the p-value cut-off of GO categories y
  enriched.GO = GO.wall$category[p.adjust(GO.wall$over represented pvalue, method = "BH") < 0.05]
  enriched.GO
  my.GO <- as.character(enriched.GO)
  my.GO.table <- Term(my.GO)</pre>
  mv.GO.table
  t <- as.matrix(my.GO.table)
  print(type) #this is for the knitr document
  print(t) #this is for the knitr document
  write.table(t, file = paste(sample1,"_",sample2,"DE1_sigonly_",type,"_GO.txt", sep = ""))
write.table(GO.wall, file = paste(sample1,"_",sample2,"DE1_sigValues_",type,"_GO.txt", sep = ""))
}
## Using manually entered categories.
## For 6946 genes, we could not find any categories. These genes will be excluded.
## To force their use, please run with use_genes_without_cat=TRUE (see documentation).
## This was the default behavior for version 1.15.1 and earlier.
## Calculating the p-values...
## 'select()' returned 1:1 mapping between keys and columns
```
